

**Artesunate (injectable and rectal capsules), artemether lumefantrine paediatric, ribavirin.**

MSF is supporting the introduction of injectable artesunate, artesunate rectal capsules, artemether lumefantrine paediatric and ribavirin in the WHO EML. However, attention should be paid to the quality of the sources available on the worldwide market for such products.

We would like to recommend that these products and dosage forms are assessed by the WHO prequalification team and therefore listed in the Expression of Interest to allow manufacturers to submit their dossier for evaluation.
